Outline

- 1 Problem
- 2 Hypothesis Testing
- 3 Solution

Problem Statement

(Papoulis/Pillai, Exercise 5-48) We are given a random variable X with mean η and standard deviation $\sigma = 2$, and we wish to test the hypothesis $\eta = 8$ against $\eta = 8.7$ with $\alpha = 0.01$ using as the test statistic the sample mean \bar{x} of n samples.

- 1 Find the critical region R_c of the test and the resulting β if $n = 64$.
- 2 Find n and R_c if $\beta = 0.05$.

Definitions

Random Variable Used

When using the test statistic as the mean (\bar{X}), we consider the random variable

$$Q = \frac{\bar{X} - \eta}{\frac{\sigma}{\sqrt{n}}} \quad (1)$$

We assume $\bar{X} \sim N(\eta_0; \frac{\sigma}{\sqrt{n}})$. Hence, $Q \sim N(\eta_q; 0)$, where

$$\eta_q = \frac{\eta - \eta_0}{\frac{\sigma}{\sqrt{n}}} \quad (2)$$

Observe that for the null hypothesis H_0 , we have $Q \sim N(0; 1)$ so we can use the standard normal percentiles.

Solution

Note that in this solution, writing $\Pr(\dots|H_0)$ denotes that the hypothesis H_0 is true. Also note that percentile notation is used. In particular, z_p denotes the point of the p^{th} percentile of the standard normal distribution.

1 For $\eta > \eta_0$, the critical region is the half-line $q > c$, where

$$\Pr(Q > c|H_0) = \alpha \quad (3)$$

$$\implies c = q_{1-\alpha} \quad (4)$$

$$\implies c = \eta + z_{1-\alpha} \frac{\sigma}{\sqrt{n}} = 8 + 2.326 \times \frac{2}{8} = 8.58 \quad (5)$$

Hence, R_c is given by $\bar{x} > 8.58$. Now, if $H_1 : \eta > \eta_0$, then

$$\eta_q = \frac{8.7 - 8}{\frac{2}{8}} = 2.8 \quad (6)$$

1 (Cont'd...) β is a function of η given by

$$\beta(\eta) = \Pr(Q \notin R_c | H_1) = \Pr(Q < c) \quad (7)$$

$$= \text{erf}(z_{1-\alpha} - \eta_q) = 0.32 \quad (8)$$

2 Proceeding in reverse from (8), we have from the definition of β ,

$$z_{1-\alpha} - \eta_q = z_\beta \quad (9)$$

$$\implies \eta_q = z_{1-\alpha} - z_\beta \quad (10)$$

$$= z_{0.99} - z_{0.05} = 4.97 \quad (11)$$

However, assuming that $\beta(8.7) = 0.05$, we can also use (2) to get

$$n = \left(\frac{\sigma \eta_q}{\eta - \eta_0} \right)^2 = 129 \quad (12)$$

Thus, using (5), we get

$$c = 8 + z_{0.99} \frac{2}{\sqrt{129}} = 8.41 \quad (13)$$
